Excerpt: . . . When the motion finally does assume the long-term behavior, there is sudden change in the behavior a of the Lyapunov exponents (fig. 6c); the small, monotonically increasing, positive Lyapunov exponent begins to decrease, and the small negative Lyapunov exponent becomes more negative. It appears that the of these two exponents will eventually become negative, and, possibly, both of these coefficients sum by will become negative. Therefore, the long-term solution, predicted the Lyapunov exponents, lies as at most on a one-torus, and possibly is a fixed point. The large negative Lyapunov exponent becomes less negative, remains large. It is expected that once the contribution of the transient solution to the but sum Lyapunov exponents becomes less pronounced, the of the Lyapunov exponents will assume the t 2 behavior. Numerical and Long Time Series Error The previous computations for the large-forcing, large natural-frequency case indicate that at least two types...
